Re: AI Research Engineer (Agentic Reinforcement Learning)

Dear Hiring Committee,

I am a researcher and lecturer with a PhD in Computer Engineering, focusing on evaluation metrics for large language models and multimodal text summarization. At Yozgat Bozok University I lead the Computer Technologies Department and coordinate international academic activities, which has given me solid experience in building and managing research infrastructure for large-scale experiments.

My recent work on LLM-as-judge and hybrid metrics directly tackles reward modeling and evaluation, topics that overlap with the reward-optimization challenges you describe. I have also co-founded a technology center where we built prototype systems that integrate text and image data, giving me hands-on experience with multimodal pipelines.

While my background is strongest in natural language processing and trustworthy AI, I have a strong theoretical foundation in machine learning and have contributed to two patents related to AI system design. I am eager to apply this expertise to reinforcement learning for multimodal agents and to learn the specific RL techniques required for your projects.

I look forward to discussing how my research experience and leadership skills can support the development of scalable, reliable AI agents at your organization.

Best regards,
Anıl Kuş
